## 1 概述

BONENG AM系列驱动器的设计目标是为交流异步电机提供经济、紧凑的速度控制方案。

按照尺寸的不同（外形尺寸M 1 - M 2 ）功率范围覆盖0.75KW~5.5KW，广泛适用于变频驱动的应用场合。

BONENG AM系列驱动器可通过多种方式对自身与所接电机进行控制和监控。支持Modbus通信进行控制，也可通过监控设备和输入/输出端子直接控制。BONENG AM系列驱动器采用了高性能的IGBT，电机电压脉宽调制技术以及可旋转的供电频率调制技术，使得电机运行极为灵活可靠。此外，多方面的保护功能可以为驱动器和电机提供更高级别的保护。

内置操作面板由数码管、指示灯与按键组成，可显示设定频率、输出频率、各种监视数据以及故障代码，用于对变频器的调试、运行监控以及输入参数设置。

## 1 Summarize

BONENG AM series drives provide an economical and compact solution for AC induction motor speed control.

The power range of the two sizes (M1 and M2) is from 0.75KW to 5.5KW , which is widely suitable for inverter applications.

The driver can monitor itself and the connected motor in a variety of ways. The drive supports Modbus communication control, monitoring equipment control, and input/output terminals direct control. BONENG AM series drives adopt high performance IGBT, motor voltage pulse width modulation technology and rotatable power supply frequency modulation technology, making motor operation extremely flexible and reliable. In addition, multifaceted protection functions provide a higher level of protection for drives and motors.

The built-in operation panel is composed of digital tube, indicator light and keys, which can display setting frequency, output frequency, various monitoring data and fault codes for debugging, monitoring operation and setting input parameter of the frequency converter.

## 9 可选件

当系统的故障率高时,需要加装进线电抗器改善驱动器的输入侧功率因数,以保护驱动器免受过大的谐波电流的干扰;防止过载并将进线谐波限制在允许的值内,以确保驱动器达到期望的使用寿命。

进线滤波器的作用是抑制驱动器通过输入电源线所传输到公共电网中的电磁干扰,同时也衰减从电源线进入驱动器的干扰;在安装时请尽量靠近驱动器的输入端子侧进行安装,请使用驱动器专用的进线滤波器。

当驱动器和电机之间的距离超过50米时,由于长电缆对地的寄生电容效应导致漏电流过大,驱动器容易频繁发生过流保护,为了避免电机绝缘损坏,须加输出电抗器补偿,输出电抗器可以减小电机绕组上的电压负载,以及采用长的电机电缆时,容性充放电电流加在功率部分的附加负载。

制动电阻用于使大转动惯量的负载迅速制动。在电机和负载制动时,动能转换成的再生电能会返回到驱动器中,直流母线电压因此抬高,驱动器将这些再生的能量几乎全部消耗在制动电阻上。400V 50/60Hz AM系列驱动器可选的制动电阻推荐规格如下:

## 9 Options accessories

When the failure rate of the system is higher, it is necessary to install a line reactor to improve the input power factor of the drive to protect the drive from excessive harmonic current interference; Prevents overloads and limits incoming harmonics to allowable values to ensure the drive achieves the desired service life.

The function of the incoming filter is to suppress the electromagnetic interference transmitted by the drive through the input power line to the public grid, and also attenuate the interference from the power line into the drive. Please install as close as possible to the input terminal side of the drive, please use the drive special incoming filter.

When the distance between the drive and motor exceeds 50 m, the leakage current is too large due to the parasitic capacitance effect of the long cable to the frequent over-current protection. In order to avoid damage to the motor insulation, an output reactor must be added to compensate. The reactor can reduce the voltage load on the motor windings, and when a long motor cable is used, the capacitive charging and discharging current adds to the additional load of the power section.

Braking resistors are used to brake loads with large moment of inertia quickly. When the motor and the load are braking, the kinetic energy converted into regenerated electricity will return to the drive, thus direct current bus voltage is raised, the driver will use up almost all of this regenerated energy on the brake resistance; 400V 50 / 60Hz A1 series driver. The recommended specifications of the selected braking resistor are as follows:
